

Infnote Seeder

Zhao Cai

赵 才

What is Infnote Seeder

- 1. When started for the first time, programs don't know the IP addresses of any **active full nodes**.
- 2. Infnote seeder is a crawler for the Infnote network, which exposes a list of **active full nodes** via a built-in DNS server, just like bitcoin seeder.
- 3. Features:
 - a.** regularly revisits known nodes to check their availability
 - b.** bans not good nodes

Key Python Packages used

- **1.gevent is used to start coroutines**
- **2.gevent.queue is used as request message queue**
- **3.dnslib is used to encode/decode DNS packets**
- **4.pyrlru is used as LRU cache**

Steps of infnote_dns

- **1. start udp sever**
- **2. accept requests, and store in deq_cache**
- **3. get data from deq_cache**
- **4. decode DNS packets from data**
- **5. query in dns_cache if dns db does not change,
else query in dns db , and return**

Steps of infnote_dns 1

■ 1. start udp sever

```
.55 class DNSServer(object):
.56     @staticmethod
.57     def start():
.58         # cache the request
.59         DNSServer.deq_cache = Queue(maxsize=deq_size) if deq_size > 0 else Queue()
.60         # LRU Cache
.61         DNSServer.dns_cache = pylru.lrucache(lru_size)
.62         # process the queue
.63         gevent.spawn(init_cache_queue)
.64         # start DNS sever
.65         logger.info('Start DNS server at %s:%d\n' % (ip, port))
.66         dns_server = socketserver.UDPServer((ip, port), DNSHandler)
.67         dns_server.serve_forever()
.68
```

Steps of infnote_dns 2

- 2.accept requests, and store in deq_cache

```
class DNSHandler(socketserver.BaseRequestHandler):  
    def handle(self):  
        if not DNSServer.deq_cache.full():  
            # cache request client_address sock  
            DNSServer.deq_cache.put((self.request[0], self.client_address, self.request[1]))
```

Steps of infnote_dns 3

- 3. get data from deq_cache

```
def init_cache_queue():  
    '''  
    :return:  
    '''  
    while True:  
        # get request from queue  
        data, addr, sock = DNSServer.deq_cache.get()  
        # handle request  
        gevent.spawn(handler, data, addr, sock)
```

Steps of infnote_dns 4&5

- 4. decode DNS packets from data
- 5. query in dns_cache if dns db does not change, else query in dns db , and return

```
77 def handler(data, addr, sock):
78     """
79     handle requests
80     :param data:
81     :param addr:
82     :param sock:
83     :return:
84     """
85     global mtime_before
86     try:
87         dns = dnslib.DNSRecord.parse(data)
88     except Exception as e:
89         logger.info('Not a DNS packet.\n', e)
90     else:
91         dns.header.set_qr(dnslib.QR.RESPONSE)
92         # get request name
93         qname = dns.q.qname
94
95         if os.path.exists(file_infnote_db) is False:
96             logger.info('infnote_db file is updating or not exists')
97             response = DNSServer.dns_cache.get(qname)
98             if response:
99                 ...
100             else:
101                 logger.info('get nothing from cache, please check the infnote_db file')
102         # query response in LRUcache if file_infnote_db do not change or was updating
103         elif os.stat(file_infnote_db).st_mtime == mtime_before:
104             logger.info('infnote_db file does not change')
105             response = DNSServer.dns_cache.get(qname)
106             ...
107             if response:
108                 ...
109             else:
110                 ...
111         else:
112             mtime_before = os.stat(file_infnote_db).st_mtime
113             logger.info('query from infnote_db file')
114             # query from db file if not in cache
115             answers, soa = query(str(qname).rstrip('.'))
116             answer_dns = pack_dns(dns, answers, soa)
117             # cache response
118             DNSServer.dns_cache[qname] = answer_dns.pack()
119             sock.sendto(answer_dns.pack(), addr)
```

Steps of crawler

- 1. init a ip dict **ips** = {'47.74.45.239':False}
the value is False indicates the fullnode is not visited
- 2. want_peers from the not visited fullnodes in ips
- 3. get peer's ip from the response meassge and update ips
If the fullnode is visited, set the value as True
- 4.Repeat step 2 and 3, until all the fullnodes are visited
- 5.Generate infnode_db.csv and nodes.csv, a report of fullnodes' availability

Steps of crawler 1

- 1. init a ip dict **ips** = {'47.74.45.239':False}

the value is False indicates the fullnode is not visited

```
}  
full_node1_ip = '47.74.45.239'  
full_node1_port = '32767'  
# True means was crawled  
ips = {'47.74.45.239':False}  
ports = ['32767']
```

Steps of crawler 2,3&4

```
async def request_peers(ip='47.74.45.239', port='32767'):
    good = True
    logger.info('try to connect ' + ip)
    try:
        async with websockets.connect(get_ws_url(ip, port)) as websocket:
            await websocket.send(json.JSONEncoder().encode(message))
            time_out_flag = False
            try:
                response = await asyncio.wait_for(websocket.recv(), timeout=1)
            except asyncio.TimeoutError: ...
            finally:
                if(time_out_flag is False): ...
                return
    except OSError as error: ...

    finally:
        ips[ip] = True
        if(good):
            logger.info(ip+' is good')
            f.write('infnote.com,' + ip + '\n')
            nodes_file.write(ip + ',yes,' + time.strftime("%Y-%m-%d %H:%M:%S", time.localtime()) + '\n')
        else:
            nodes_file.write(ip + ',no,' + time.strftime("%Y-%m-%d %H:%M:%S", time.localtime()) + '\n')
        return
```

Steps of crawler 5

```
def main():
    # asyncio.get_event_loop().run_until_complete(request_peers(ip, port))
    global ips
    while False in list(ips.values()):
        for ip in list(ips.keys()):
            #for k, v in ips.items():
            if(ips[ip] == False):
                asyncio.get_event_loop().run_until_complete(request_peers(ip, '32767'))
                # asyncio.get_event_loop().run_until_complete(request_peers('47.74.45.239', '32765'))
                ips[ip] == True

    logger.info('crawled ips ' + str(ips.keys()))
    nodes_file.close()
    f.close()
    old_file = 'infnote_db_old.csv'
    new_file = 'infnote_db_new.csv'
    current_file = 'infnote_db.csv'
    if os.path.exists(old_file):
        os.remove(old_file)
    if os.path.exists(current_file):
        os.rename(current_file, old_file)
    os.rename(new_file, current_file)
```

The end

Thanks
